Who would think a creature so small would have such a huge impact on the world? One bee may visit up to 5,000 flowers in a single day. Pollination happens when there is a transfer of tiny pollen cells from one part of a plant to another part, so that a plant can produce seeds. It is believed that in North America 30% of food that humans eat is from plants pollinated by bees, as well as crops grown for livestock. They are one of the hardest working insects in the world.

I love to take pictures of the delicate beauty of flowers in the summer. To find a bumble bee on a flower makes it extra special, especially when you get to see it working up close. It is an amazing and unique creature. It reminds you of how the power of one can change the lives for many. It is not about how big, strong, powerful or rich you are, or what you will get back in return. It is about your determination, work ethic, and selflessness. You can help the world be a better place. Bee all you can bee, because it only takes “The Power of One.”
